

Travel & Surveillance Plan

Winter-minimizing CDMX base • One "different" trip a year • All four CT scans

The design: bank the 153-day OHIP requirement in one **warm-season Toronto block (May–mid-Oct)**; base in **CDMX** for the cold months (Feb & March out of Toronto); take the two winter scans as quick **~1-week trips home**; and slot one longer **"change of pace" trip each year** into the single scan-free gap (after the Feb scan, before the May scan). **This year: Spain + Morocco.**

Dates	Days	Where	Purpose / climate
May 5 – Oct 10	159	TORONTO — home block	CT #1 (May) + CT #2 (Aug); banks all OHIP on its own
Oct 11 – Nov 8	29	CDMX — Roma / Condesa / Coyoacán	Winter base begins; dry season, ~22°C
Nov 9 – 15	7	TORONTO — scoot back	CT #3 (mid-Nov) — ~5-hr hop
Nov 16 – Dec 17	32	CDMX	Dry, sunny, festive
Dec 18 – Jan 1	15	TORONTO — Christmas <i>(optional)</i>	Family — or stay in CDMX
Jan 2 – Feb 9	39	CDMX	Peak dry season, clear & mild
Feb 10 – 16	7	TORONTO — scoot back	CT #4 (mid-Feb) — ~5-hr hop
Feb 17 – Apr 5	48	SPAIN + MOROCCO — annual "different" trip	Andalusia + Morocco; spring (Schengen; insured)
Apr 6 – May 4	29	CDMX	Back to base; jacarandas in bloom
Totals	365	Toronto 188 • CDMX 129 • Trip 48	4 scans · winter minimized · 1 big trip/yr

The "different" trip rotates year to year (Spain/Morocco → Portugal, Italy, Japan, a Cuenca return...). It always sits in the Feb–May scan-free gap, so surveillance is never disrupted. Spain's Schengen days (~3 wks) stay far under 90; Morocco is non-Schengen.

Version 2 — the Médica Sur stretch (zero Toronto winter). If her PMH oncologist accepts an outside CT, do the **November and February scans at Médica Sur (CDMX, JCI-accredited)** — full DICOM sent to PMH — and drop both winter scoot-backs. OHIP is still met by the ~159-day summer block alone. Gated on the oncologist's answer (see the PMH question sheet).

- **OHIP banked in the warm season** — the ~159-day block satisfies the 153-day rule on its own, so winter travel isn't constrained by it.
- **Minimal Toronto winter** — Feb & March in CDMX or on the trip; the only cold-month returns are ~1-week scan trips.
- **The annual trip fits the scan-free gap** (Feb→May), so surveillance is never disrupted.
- **Familiar CDMX base makes self-insuring safe** — same hospitals (ABC, Médica Sur).
- **Médica Sur away-scans (Version 2)** → zero winter Toronto, once PMH accepts DICOM.
- **The trip rotates** — swap Spain/Morocco for Portugal, Italy, Japan, or a month back in Cuenca (which you know well).
- **Skip Christmas** → a more continuous CDMX winter; OHIP still met by the summer block.
- **Stay closer any year** → drop the trip or extend the Toronto block; nothing abroad is owned or prepaid.

Dates are illustrative and repeat annually. Adjust the surrounding blocks to whatever PMH schedules; the mid-August CT is the next real anchor.

Rough Cost Estimate

Order-of-magnitude planning figures • USD unless noted, for a couple • FX ~0.72 USD/CAD

Travel costs

CDMX winter base — ~4.3 months living @ ~\$4,300/mo + flights (main RT + 2 scan scoot-backs)	~\$22,000
Annual "different" trip — Spain + Morocco, ~7 weeks (transatlantic flights + lodging + living)	~\$12,500
Travel subtotal	~\$34,500

CDMX runs higher per-day than dispersed LATAM (premium neighborhoods) but flights are short and cheap. The Spain/Morocco trip is the year's splurge; Morocco is markedly cheaper than Spain, which softens the total.

Fixed annual baseline

Downtown Toronto apartment — \$4,000 CAD/mo × 12 = \$48,000 CAD (retained; walking distance to PMH; no subletting)	~\$34,600
Insurance — catastrophic / medical-evacuation membership (CDMX base) *	~\$800
Insurance — Schengen-compliant travel policy for the annual trip *	~\$2,000
Toronto living during home months (food, transport)	~\$12,000
Baseline subtotal	~\$49,400

Annual picture

Travel — CDMX winter base	~\$22,000
Travel — annual "different" trip (Spain/Morocco)	~\$12,500
Toronto apartment (full year)	~\$34,600
Insurance (evac membership + trip Schengen policy)	~\$2,800
Toronto living during home months	~\$12,000
Estimated annual total	~\$84,000
Annual income (~\$14,100 USD / mo — see p.3)	~\$169,000
Surplus before OSS project	~\$85,000

Cash-flow positive with wide margin — roughly **\$7,100/month** before the OSS project, **~\$4,000/month** after it, and no draw on the \$1M principal. The annual different-trip (~+\$8k over a plain CDMX year) is a deliberate, fully-funded feature of the plan, not

a stretch.

*** Insurance — two layers, and no OHIP backstop. OHIP does not reimburse emergency care received outside Canada** — the Out-of-Country Travellers Program ended January 1, 2020, and even before then it paid only token rates (~\$50/day outpatient, \$200–400/day inpatient, ~5% of real costs). So this coverage is your *sole* backstop abroad, not a supplement. The CDMX base runs on **self-insure + a catastrophic/medical-evacuation membership**: pay cash for routine/moderate care at world-class private hospitals, treat there or fly home. The annual Europe/Morocco trip is covered by a single **Schengen-compliant travel-medical policy** (Spain requires proof of coverage; the policy covers the whole trip including Morocco). Verify: her cancer is excluded from travel insurance regardless; medevac memberships often have **age caps (~75+)** — read the terms; confirm the trip policy's per-trip day cap covers ~7 weeks. (*Non-urgent care still defers to Toronto, where OHIP covers it normally.*)

Income Structure & Resilience

How the plan is funded — and why it holds up under a market or health shock

The plan rests on three layers. Each funds a different kind of commitment, and the only variable layer has a built-in throttle — so a bad market costs you *scope*, never *security*.

Layer	Source	CAD / yr	Funds	Nature
1 — Floor	Pensions — US \$7,000/mo (TRS + SS) + CA \$1,500 CAD/mo	\$135,000	The entire lifestyle plan (~\$117k CAD)	Guaranteed, non-discretionary
2 — Reserve	Distributions on \$1M (dividends + call premiums)	\$100,000 (~10%)	OSS project + compounds surplus	Variable; excludes appreciation; goes to cash on a serious drop
3 — Discretionary	Drawn from Layer 2	≤ \$50,000	OSS software project (1–2 yrs)	Time-boxed; burn throttled to Layer 2
Commitments vs. potential income		~\$167k / \$235k	Cash-flow positive at full burn; principal untouched	

Why it is resilient

- **The pensions alone cover the entire plan** (~\$135k CAD vs. the ~\$117k CAD lifestyle — roughly \$18k CAD to spare, and all non-travel costs with wide room). A downturn never forces you to sell into a falling market to fund the year.
- **Most of the floor is US-dollar income against partly-CAD costs.** The bulk of your pension (~\$117k of the ~\$135k CAD is US TRS + Social Security) is paid in USD, while the apartment and Canadian living are in CAD — a mild FX cushion if the US dollar holds or strengthens.
- **The annual trip is discretionary** — in a lean market year, drop it and the plan cost falls ~\$8k with zero effect on the essentials.
- **The \$1M principal is never touched** by lifestyle or project. It stays as liquid reserve for a major medical event — and the estate.

Treat the ~10% distribution yield as reserve, not income. That ~\$100k CAD of dividends and call premiums is *variable, not a floor* — premiums shrink and the program moves to cash in a downturn, and the figure excludes any appreciation or loss. Because none of it is budgeted as required income, that variability never threatens the plan. Keep the wall firm: pensions are the floor, the portfolio is the reserve.

Planning estimates only, for a couple. CAD figures where the underlying amounts are Canadian; USD conversions at ~0.72. Verify flights, lodging, and insurance with live quotes before committing.
